Proponent: Commodity Classification Standards Board

Analysis

This proposal would update and clarify the provisions, and adjust the class, for mail, as presently named in item 188150. Since the proposal was docketed, 39 new density figures have been received on shipments of mail. The new data supports the previous data in that the range in densities — from 2.10 to 44.56 pcf — has not changed. The average, however, has slightly increased to 15.45 pcf. The updated frequency distribution chart below confirms that the majority of density figures are near the average density.
